

ORIGA RODLESS CYLINDERS AT WORK

Problem

A major manufacturer of nappies needed to move the product in their packaging department. The individual nappies had to be moved across a conveyor to a bagging station.

Solution

An Origa P230 rodless guided cylinder was used in conjunction with rodded cylinders attached to the yoke. An arm was connected to a pivot which enabled it to move out of the path of the conveyor. The operation was controlled by control valves and proximity sensors.

Results

- Low maintenance requirements
- Simple engineering
- Self guiding, inherently rigid.
